

Malignant Melanoma Webinar: An update for GPs

Wednesday

14

AUGUST

**Presented
by cancer
specialists**

The risk of an individual dying from melanoma by their 85th birthday is now one in 118 people. Yet, melanoma is primarily preventable if found in the early stage.

General practitioners are at the front line of skin cancer detection for most Australians.

Presented by leading clinical specialists, this webinar will include the diagnosis of malignant melanoma and highlight some of the more recent advances in investigations and treatment relevant to general practice including immunotherapy.

Join this webinar to:

- Learn the latest on the diagnosis of malignant melanoma
- Discover advances in investigations and treatment
- Discuss overall melanoma management and the role of the GP

By the end of the session you will be able to:

- Identify malignant melanoma
- Biopsy suspicious lesions
- Implement a process to refer appropriate patients for a sentinel node biopsy
- Recognise the more frequent and the more serious side effects of some types of immunotherapy (particularly those used in treatment of malignant melanoma)

SPEAKERS

A/Prof Victoria Mar, the Director of the Victorian Melanoma Service at The Alfred and Adjunct Associate Professor at the School of Public Health and Preventative Medicine, Monash University.

A/Prof Shahneen Sandhu is a medical oncologist and researcher with an appointment in the skin and melanoma unit at the Peter MacCallum Cancer Centre

Dr Rajakumar Senthilkumaran is a Victorian GP with a special interest in Melanoma.
